Can i move whatsapp messages from android to iphone.

Since it was founded in 2009, WhatsApp has become one of the apps you're most likely to find on phones worldwide. Today, it has over 2 billion users in 180 countries - even more than users of its stablemate, Facebook Messenger, which is presumably why Mark Zuckerberg's company were so keen to gobble it up for an eye-watering \$19 billion in 2014. A new privacy policy revealed in January 2021 has meant the app requires you to share certain personal details with Facebook to continue using the app. To use WhatsApp past February 8, 2021, you'll need to agree to the new terms that allow Facebook to see data including your phone number, status messages, profile names, IP address and more. Many are looking to switch to an alternative app to ensure they don't have to share this data with Facebook, and that's where this list comes in. Below we've listed a variety of the top alternatives you can switch to as an alternative to WhatsApp. WhatsApp vs Signal vs Telegram Image credit: Telegram (Image credit: Shutterstock) Telegram is perhaps WhatsApp's closest competitor in terms of functionality - and it even looks almost identical to the Facebook-owned behemoth. What sets it apart is that it doubles down on the promises over security: not only are messages end-to-end encrypted, but it is possible to set messages to self-destruct after a given period of time - leaving no trace of whatever important conversations you were having. One other nice feature is that, unlike WhatsApp, it's truly multi-platform - with apps available for desktop, as well as mobile and on the web. Download Telegram for iPhone (opens in new tab) and Android (opens in new tab) Image credit: Signal (Image credit: Signal) Signal Many of these alternatives boast about their security credentials but if you're really paranoid there's only one option. Signal offers a similar suite of features to its competitors, as well as end-to-end encryption, but there's one big difference. The app itself is open-source. This means that all of the code for the app is publicly available to view, making it impossible for the creators to sneak in any backdoors that could give governments or hackers access to your messages. The app has also scored a major endorsement to bolster its privacy credentials even further in the form of NSA whistleblower Edward Snowden. Download Signal for iPhone (opens in new tab) and Android (opens in new tab) (Image credit: Apple) iMessage In response to the growth of WhatsApp, Apple has built out its own Messages app - iMessage - to be just as fully featured. Now, when messaging iPhone to iPhone, there are no character limits, you can send pictures, videos and... well, pretty much anything, thanks to a plethora of app integrations. Most notably, this includes Apple Pay in some countries, so that you can literally send money over text and, of course, Animojis. Hit a button and rather than type out your missive, you can perform it as a 3D animal puppet, with the fox, monkey or unicorn's mouth movements matching your own. And yes, you can also be a talking poop emoji, but we recommend only using that when, say, dumping someone or telling a loved one about a death in the family. There's just one catch: iMessage is, by design, only available on Apple devices, so if you want to chat with your Android mates you've got to go back to using plain old 140-character SMS. You'll find iMessage already downloaded to your iPhone Image credit: Google Google Messages In response to Apple not playing nicely with iMessage, Google launched its own Android-only messaging service called... Messages. Available on the Play Store, this app also replaces your standard SMS app, and the big point in its favor is that it deeply integrates with all of Google's apps and services. This means that you can easily share images from your Google Photos, or use Google Assistant to make a restaurant reservation with a friend from right within the app. Download Google Messages on Android (opens in new tab) (Image credit: Facebook) Facebook Messenger This won't avoid the issue of sharing your data with Facebook, but it does pose a suitable alternative to WhatsApp for some. Facebook Messenger is an integral part of the Facebook experience, but a separate app enables private messaging between individuals and groups. You may find this is more suitable for you than WhatsApp, especially as it works separately from a phone number so you can use it across multiple devices at once without having to reauthorize the app. Download Facebook Messenger for iPhone (opens in new tab) and Android (opens in new tab) An example of Viber's disappearing messages (Image credit: Viber) Line, Viber, WeChat and others There are a number of other messaging apps out there which have millions of users. Line, for instance, reportedly had 700m registered users in 2019 and Viber supposedly had 260m active users every month then too. Some of these apps have some really interesting functionality too - for example, WeChat has an entire mini-app eco-system inside of the app, so that you can shop, order taxis and so on without leaving WeChat itself. But we wouldn't necessarily recommend making the switch to these apps as they may not be all that useful. Why? Because they're mere minnows in the English-speaking world. WeChat dominates China, Line is the go-to messenger in Japan, and BlackBerry Messenger is the biggest in Indonesia (no, really) - which are great if you live there. If you're in the UK, the United States, or Australia however, you're not going to find that many of your friends on these apps. Image credit: Shutterstock (Image credit: Shutterstock) A good old-fashioned phone call Finally, we have one obscure option that we don't think many people will pick - but one that is worth mentioning. It's a little known fact that every phone has one app built in that is always running. Every user is given a unique ID number, which if entered by another person, will interrupt whatever else you're doing on your phone and force you to pay attention. It will even play a long, annoying sound to capture your attention. The "Telephone" app has its critics, but it is a technology dating back over a century, and is still a serviceable way to stay in touch with your loved ones. Who knows, maybe your mum would enjoy hearing your voice every once in a while. WhatsApp vs Signal vs Telegram By Melly Parker | Justin Sullivan/Getty Images News/Getty Images The message system in iOS is designed to give you confidence in your correspondence. One feature iMessage offers is a read receipt, a type of notification that gives a message sender more information about the status of the message he sent. A sender knowing whether you've read his message is dependent on the settings you've selected on your iPhone. One message notification that always appears is the "Delivered" notification. It indicates that the message has reached the recipient's iMessage inbox. The other notification that appears below a message is "Read," which indicates that the recipient has opened iMessage and viewed the message in question. If you start to reply to a message in iMessage, a speech bubble icon that displays an ellipsis will appear at the bottom of the messages list to let the other person know you're in the process of responding. Read receipts can be turned on and off so that you can adjust how you want iMessage to function with the messages you send. If you toggle the feature off, then the message status will always say "Delivered," even if you've read the iMessage in question. If you toggle it to "On," then the message status will update to "Read" when you've seen the message. Decide which one to use based on what level of privacy you want. The selection you make applies to every iMessage conversation in the app; you can't adjust settings for individual users. To change whether a person can see that you've read his message, tap "Settings" on your home screen and then tap "Messages." Adjust the slider bar next to "Send Read Receipts" to "On" or "Off," depending on whether you want read receipts to be active or inactive. When they're active, a timestamp showing when a message was read is added to the message, along with a "Read" notification for the sender to see. When an iPhone user receives a push notification that alerts him to a new iMessage, he can read part of the message text without opening the app. In a similar vein, an iPhone user can read part of an iMessage text on his lock screen without a read receipt alerting the sender that it has been seen. To display an active read receipt, the iMessage app must actually be opened. Switching to Android from an iPhone isn't as cumbersome as it used to be. While Apple still heavily restricts what goes in and out of your iPhone, recent updates have made it easier than ever to migrate your data, such as contacts and pictures, to an Android phone. With the right tools, you can bring along most of the data your iPhone has collected for years, including your media gallery, calendar appointments, local files, and more, to your new Android phone. Here's how to get started. The quickest and the most reliable way to move your iPhone's data is with your Android phone's built-in migration app. Most Android phones ship with a one-stop tool that lets you instantly import your iPhone's contacts, pictures, videos, texts, call history and other documents. If your new Android phone comes equipped with such a service, you likely won't need to go anywhere else. While setting up a Google Pixel, for instance, you're asked if you'd like to transfer content from your old iPhone. Once you opt in, all you need to do is connect both the devices with the dongle in your Pixel's box and, within minutes or hours depending on the amount of data you have, you should be all set. In addition to the usual collection of information such as texts and call logs, the Google Pixel also automatically downloads Android counterparts for the apps you have installed on your iPhone. Similarly, Samsung Galaxy phones have an app called "Smart Switch," which can wirelessly export all your iPhone data like apps, contacts, call logs, messages, photos, and videos. Unlike Google's solution, you can take advantage of Smart Switch even after you've set up your Samsung Galaxy phone. In case your Android phone doesn't support an all-in-one transfer app, or if it's not available beyond the initial setup stage, Google Drive is your next best option. However, this method is far from perfect since the Google Drive app can only sync your iPhone's contacts, calendar appointments, and photo library. For the rest of the content, like texts and call logs, you'll have to look for any alternate channels, which, unfortunately, aren't that many. Download the Google Drive app (opens in new tab) on your iOS device and sign in with the same Google account you plan to use on your Android phone. Tap the three-line button at the top left corner and head into Settings > Backup. (Image credit: Laptop Mag) Select what kind of data you want to include in the backup. From the "Photos & Videos" option, you can also specify whether you'd like to upload your photos and videos in their original quality or a space-saving compressed format. Tap "Start Backup," and your iPhone will begin backing up the files on your Google cloud storage. Once it completes, the data should be available in its respective app on your Android phone. So, contacts will go into the Contacts app, events in Calendar, and media in Google Photos. Transfer iPhone data to Android via third-party service For the remainder of your iPhone data, you can turn to third-party services like MobileTrans (opens in new tab). This desktop software can transfer content between phones with a click of a button. It can sync your contacts, call history, voicemail, reminders, and just about everything else you'd want to keep from your old phone - for a price. MobileTrans is not free, and you will have to shell out at least \$45 to access it. (Image credit: Laptop Mag) If you do decide to pay for MobileTrans, there's little you need to do next. Start by plugging in both your iPhone and Android phone to your Mac or Windows PC. Open the MobileTrans app and grant the necessary permissions from the pop-ups on your devices. Keep your phones unlocked while MobileTrans will take a couple of minutes to siphon up all the data from them. On the MobileTrans app, make sure your iPhone is on the left side of the window, and in case it isn't, click the "Flip" in the top center. Now, pick what data you want to migrate from the list of checkboxes in the middle and hit "Start" to kick off the transfer process. MobileTrans will move the selected data to your Android phone in a few minutes or hours and notify you when it's done. MobileTrans also offers mobile apps if you don't want to install it on your computer or migrate the data wirelessly, but it failed to work in my testing.
